

# NYD Shooting Project

Zeeshan Amjad

2024-08-10

## R Markdown

This is an R Markdown document for NYPD shooting project for Data Science as Field course.

## Loading packages

- tidyverse
- dplyr
- ggplot2

```
library('tidyverse')
library('dplyr')
install.packages('ggplot2')
```

## Loading New York Shooting Data

Read the data from the url <https://data.cityofnewyork.us/api/views/833y-fsy8/rows.csv>

```
cases_url <- "https://data.cityofnewyork.us/api/views/833y-fsy8/rows.csv"
cases <- read_csv(cases_url)
```

```
## Rows: 28562 Columns: 21
## -- Column specification -----
## Delimiter: ","
## chr  (12): OCCUR_DATE, BORO, LOC_OF_OCCUR_DESC, LOC_CLASSFCTN_DESC, LOCATION...
## dbl  (7): INCIDENT_KEY, PRECINCT, JURISDICTION_CODE, X_COORD_CD, Y_COORD_CD...
## lgl  (1): STATISTICAL_MURDER_FLAG
## time (1): OCCUR_TIME
##
## i Use 'spec()' to retrieve the full column specification for this data.
## i Specify the column types or set 'show_col_types = FALSE' to quiet this message.
```

## See the specification of the data

Use spec() to see the full column specification to understand the data

```
spec(cases)
```

```
## cols(  
##   INCIDENT_KEY = col_double(),  
##   OCCUR_DATE = col_character(),  
##   OCCUR_TIME = col_time(format = ""),  
##   BORO = col_character(),  
##   LOC_OF_OCCUR_DESC = col_character(),  
##   PRECINCT = col_double(),  
##   JURISDICTION_CODE = col_double(),  
##   LOC_CLASSFCTN_DESC = col_character(),  
##   LOCATION_DESC = col_character(),  
##   STATISTICAL_MURDER_FLAG = col_logical(),  
##   PERP_AGE_GROUP = col_character(),  
##   PERP_SEX = col_character(),  
##   PERP_RACE = col_character(),  
##   VIC_AGE_GROUP = col_character(),  
##   VIC_SEX = col_character(),  
##   VIC_RACE = col_character(),  
##   X_COORD_CD = col_double(),  
##   Y_COORD_CD = col_double(),  
##   Latitude = col_double(),  
##   Longitude = col_double(),  
##   Lon_Lat = col_character()  
## )
```

## Preparing the data

### Change the data type

For preparing the data, change the date into date format

```
cases <- cases %>%  
  mutate(  
    OCCUR_DATE = as.Date(OCCUR_DATE, "%m/%d/%Y")
```

### Remove the unnecessary columns

Remove the following from the data - X\_COORD\_CD - Y\_COORD\_CD - Latitude - Longitude - Lon\_Lat

```
cases <- cases %>%  
  select(-c(X_COORD_CD, Y_COORD_CD, Latitude, Longitude, Lon_Lat))
```

## Display summary

```
summary(cases)
```

```
## INCIDENT_KEY OCCUR_DATE OCCUR_TIME BORO

## Group by

### Group by one level

Now doing the group by of one level, here we are doing group by – boro – year – location – gender

```
group_by_boro <- cases %>%
  group_by(BORO) %>%
  summarise(INCIDENTS = n())

group_by_year <- cases %>%
  group_by(YEAR = format(OCCUR_DATE, "%Y")) %>%
```

```

summarise(INCIDENTS = n())

group_by_location <- cases %>%
  group_by(LOCATION_DESC) %>%
  summarise(INCIDENTS = n())

group_by_gender <- cases %>%
  filter(!is.na(cases$PERP_SEX)) %>%
  filter(if_any(everything(), is.na)) %>%
  group_by(PERP_SEX) %>%
  summarise(INCIDENTS = n())

```

## Group by two levels

Now doing the group by of two levels, here we are doing group by – boro, year – year, boro – location, year – year, location

```

group_by_boro_year <- cases %>%
  group_by(BORO, YEAR = format(OCCUR_DATE, "%Y")) %>%
  summarise(INCIDENTS = n(), .groups="keep")

group_by_year_boro <- cases %>%
  group_by(YEAR = format(OCCUR_DATE, "%Y"), BORO) %>%
  summarise(INCIDENTS = n(), .groups="keep")

group_by_location_year <- cases %>%
  group_by(LOCATION_DESC, , YEAR = format(OCCUR_DATE, "%Y")) %>%
  summarise(INCIDENTS = n(), .groups="keep")

group_by_year_location <- cases %>%
  group_by(YEAR = format(OCCUR_DATE, "%Y"), LOCATION_DESC) %>%
  summarise(INCIDENTS = n(), .groups="keep")

```

## Visualize Data

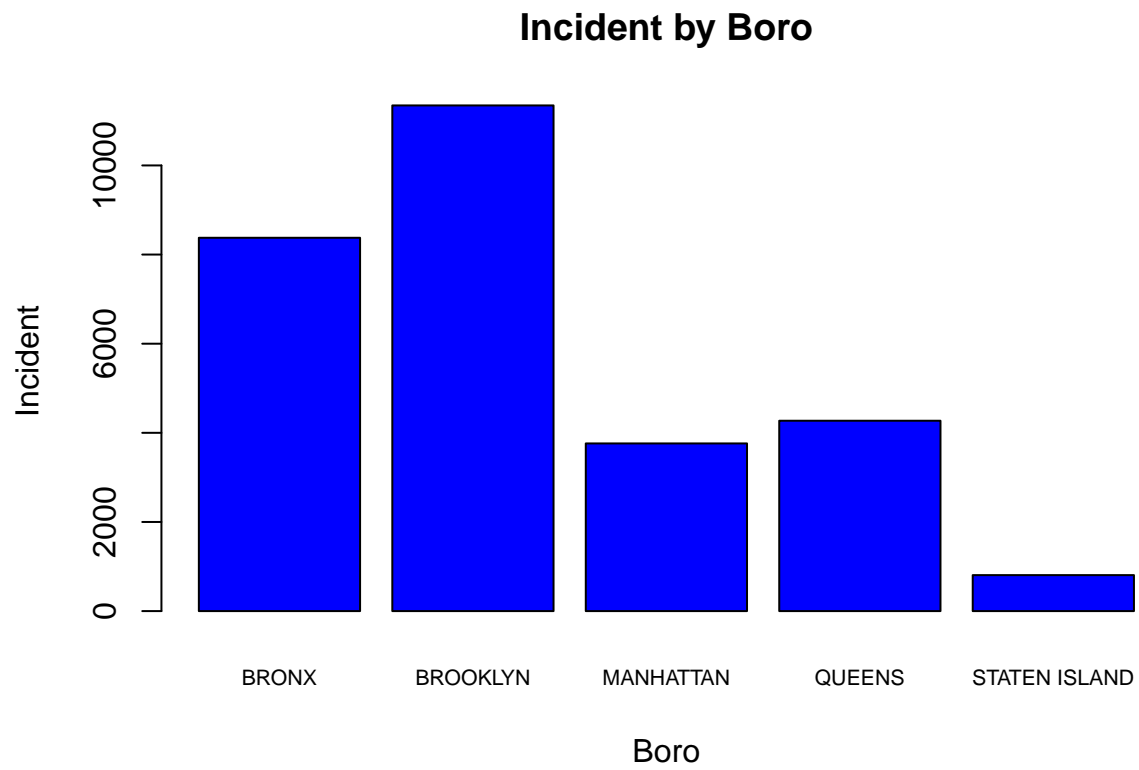

Now visualization the data of NYPD shooting incidents

### incident by boro

```

barplot(group_by_boro$INCIDENTS, names.arg = group_by_boro$BORO,
        col = "blue", cex.names = 0.7, main = "Incident by Boro",
        xlab = "Boro", ylab = "Incident")

```

### incident by year

```
barplot(group_by_year$INCIDENTS, names.arg = group_by_year$YEAR,  
        col = "green", cex.names = 0.7, main = "Incident by Year",  
        xlab = "Year", ylab = "Incident")
```

incident by location

```
barplot(group_by_location$INCIDENTS, names.arg = group_by_location$LOCATION_DESC,  
        col = "red", las=2, cex.names = 0.4, main = "Incident by Location", ylab = "Incident")
```

## Incident by Location

gender breakdown

```
pie(group_by_gender$INCIDENTS, labels = group_by_gender$PERP_SEX,
    main = "Gender break down", col = rainbow(length(group_by_gender$INCIDENTS)))
```

## Gender break down

incident by boro ever year

```
group_by_boro_year %>%  
  ggplot(aes(x=YEAR, y=INCIDENTS, group = BORO)) +  
  geom_line(aes(color = BORO)) +  
  geom_point(aes(color = BORO)) +  
  theme(legend.position = "bottom",  
        axis.text.x = element_text(angle = 90)) +  
  labs(title = "Shootings by Borough every year")
```

These visualization shows that there are less number of shooting incident on Staten Island boro making it the safest and most number of shooting incident in Brooklyn. It also shows that Male are more likely to be a perpetrator than female.

When we visualize the data over time then for year 2017 to 2019 the shooting incident decreases and it is also evident if we look at the for each boro over the time.

One possible hypothesis could be since Staten Island is not directly connected with land except two bridges, therefore it would be difficult for shooter to escape from there. However we need to further investigate to validate or invalidate this hypothesis.

Another important observation is the time frame of 2017 to 2019, the number of shooting instances reduces in all boro and further investigation needed to understand the reason behind this. There may be another factor that may cause this.

We can further explore the relationship between location and number of shooting incident, but we have lots of missing data for location, so we can't make a concrete decision based on the existing data.

## Bais

It is bais to assume that number of shooting is less on Island as compare to main land. Another important bais might be who is doing this shooting? It is from the law enforcement or crimnal? Is there a really good law and order sitaution in staten island or the geography plays an important role here.

## Conclusion

Although this dataset provide useful information and we can get new insight by grouping and visualization this, but this data is not sufficient to create any meaningful conclusion. There are two important reason for that - Some important data points are missing like location for lots of rows and who did the shooting, law enforcement, criminal or someone else - We may need to include some other datasets in our study to come up with some meaningful conclusion or even can find the missing link, relationship, causation in the current dataset.
